

Data Cleaning and Visualization Project

Introduction

The purpose of this project was to clean and prepare a dataset for analysis using Python. Raw data often contains missing values and duplicate records that can affect the accuracy of analysis.

Dataset Description

The dataset contains student academic scores, including mathematics and science scores.

Data Cleaning Process

Checked for missing values, replaced missing numerical values with averages, removed duplicate records, and verified data consistency.

Tools Used

Python, Pandas, and CSV files.

Results

Missing values were handled, duplicate records were removed, and the dataset became more reliable for analysis.

Conclusion

This project demonstrates the importance of data cleaning in preparing data for analysis and visualization.
